Skills

Python, FastAPI, PostgreSQL, Redis, LangGraph, RAG, Pinecone, Docker, GCP, Pytest, OpenTelemetry

Projects

Built a multi-agent LangGraph customer support platform that orchestrated retrieval, tool-calling, and approval workflows for enterprise tickets. The system indexed technical docs into Pinecone vector stores, used hybrid retrieval with reranking, and compared multiple retrieval strategies in an evaluation harness to improve answer quality. I also added retry logic, observability, and async job queues for production reliability.

Developed a FastAPI backend for a document intelligence assistant that processed support emails, extracted structured metadata, and routed actions through a decision graph. I implemented PostgreSQL persistence, Redis caching, and a deployment pipeline on GCP Cloud Run with Docker containers and monitoring dashboards.

Created a benchmarking suite for retrieval quality with automated evals against customer queries, measuring precision, answer grounding, and latency across chunking strategies and retrieval backends.

Experience

Senior AI Engineer, Northlake Labs — designed agentic workflows for internal automation and enterprise search.

Software Engineer, DataForge — built Python APIs, async data pipelines, and observability for analytics services.
