Skills

Python, Django, FastAPI, Celery, PostgreSQL, Redis, LangGraph, OpenAI, Docker, Kubernetes, pytest

Projects

Designed and shipped an autonomous research assistant with LangGraph for research synthesis. It combined web search, document retrieval, summarization, and stateful planning loops for a multi-step workflow. I implemented retries, fallback prompts, and logging for tool failures.

Created the API layer for a Python backend that served structured summaries to a React UI, with PostgreSQL persistence, Redis for rate limiting, and Celery task workers for asynchronous processing.

Developed a synthetic benchmark suite for agent reasoning and tool use, comparing plan quality across model iterations and prompt strategies.

Experience

Platform Engineer, Qualia Labs — built Python microservices and orchestration tooling.

Senior Backend Engineer, Data Harbor — shipped APIs and data processing workflows.
