Skills

Python, LangChain, RAG, OpenAI, Flask, PostgreSQL, Redis, AWS, Docker

Projects

Developed a customer service copilot using LangChain and vector retrieval over product documentation. The app passed user questions through prompt templates and retrieval steps to produce grounded responses with a fallback to knowledge base search.

Built a lightweight Flask API that logged conversations, stored metadata in PostgreSQL, and used Redis to cache common retrieval queries. I tracked adoption and improved response freshness through an index refresh job.

Wrote prompt evaluation notes and response quality checks for common service queries, with metrics around answer relevance and retrieval coverage.

Experience

Software Engineer, NovaStack — built AI assistant experiences and internal tooling.

Developer, Mariner Labs — maintained web services and deployment tasks.
