## Skills

Python, Django, FastAPI, PostgreSQL, Redis, Celery, AWS, Docker, pytest

## Projects

Developed a Python customer analytics platform with Django and FastAPI services for ingestion, aggregation, and policy processing. The system handled event data from mobile clients, built reporting endpoints, and stored results in PostgreSQL with Redis-based caching.

Implemented background jobs with Celery for periodic refreshes and notification workflows, including retry logic and error tracking for failed jobs. I also added monitoring dashboards and regression tests around billing logic.

Created internal APIs for reporting and operational decisions, using robust validation and structured logging for service reliability.

## Experience

Backend Engineer, Streamline Cloud — built data products and Python services for customer operations.

Senior Engineer, GridWorks — owned API reliability and platform monitoring.
