Skills

Python, FastAPI, PostgreSQL, React, Docker, GCP, Redis

Projects

Built an internal operations portal with FastAPI and PostgreSQL that aggregated deployment health, customer incidents, and service metrics. The system exposed a clean API for the dashboard, used Redis for hot query caching, and supported deployment in GCP.

Worked with product teams to add role-based access controls, ticket workflows, and historical views for operations staff. I wrote tests for service endpoints and integrated a CI pipeline for automated checks.

Worked on deployment tooling and dashboard reliability improvements to reduce incident response time.

Experience

Full-Stack Engineer, Northspring — built platform tooling for reliability and operations.

Product Engineer, Beacon Data — maintained interfaces for internal teams.
